

Lab 15 Adding Elements to a page

1. Download and open the HTML file for this assignment.
2. Notice that the body element is empty. You're going to use JavaScript to create a rainbow on the page.
3. Create an array that contains the 7 basic colors in a rainbow: red, orange, yellow, green, blue, indigo, violet. These are all colors you can reference by name for styling purposes.
4. Use a forEach loop that will iterate through the array and call a function passing one argument that is the current color.
5. Create an arrow function which will accept the color as a parameter. In the function, do the following:
 - a. Create a new HTML **div** element.
 - b. Set its background color to the color passed in as the parameter.
 - c. Add the element as the child of the **body** element.
 - d. Create a new **p** element.
 - e. Assign the new **p** element's text content to be the word passed in as a parameter.
 - f. Append the new **p** element as the child of the newly created (and last) **div**.
