

Lab 17 Keyboard and Mouse Event Handling

1. Download and extract the zip file for this assignment.
2. Open **index.html** in a browser, and open the browser console to check for any error messages as you go.
3. Open **index.html**, **styles.css**, and **index.js** for editing.
4. Note that there are image files for seven types of drums and audio files for the same seven drum sounds.
5. In the CSS, assign each of the drum images as a background image to each of the buttons corresponding to the letters **asdfjkl**. You pick which image goes with which letter. Your HTML page should look something like this:

6. In the .js file, add your name to the comment.
7. Note that each of the buttons has `class="drum"` and some text content. Select the set of buttons and use a `forEach` loop to create an event listener that puts up an alert when any one of the buttons is clicked.
8. Modify the event listener to display the letter corresponding to the button that is clicked. If the `j` button is clicked, the event listener should display an alert that `j` was clicked.
9. To play sounds on a web page using JavaScript, you create a new object from the `Audio` class and then call the `play` method (`src` is the location of the audio file):

```
let audio = new Audio("src");
```

```
audio.play();
```

Modify the event listener to play the sound `tom-1.mp3` from the `sounds` folder when any button is clicked instead of displaying the alert.

10. Write a switch statement that will play the sound corresponding to the button that was clicked. The format of a switch statement is:

```
switch (expr) {  
  case 'a':  
    steps to do  
    break;  
  case 'b':  
    steps to do  
    break;  
  ...  
  default:  
    steps to do  
}
```

11. Write another event listener which triggers an alert statement when a key is pressed.
12. Move the switch statement into a new function and call this function from both event listeners so that

a sound is played when the user clicks on one of the buttons or when a user clicks one of the keys **asdfjkl**. For full credit both mouse clicks and key presses should use the same function to play the sound.

13. Remove the alert that shows when the key is pressed.
14. Take a look at your code. Do you see any redundancy? If so, make it more concise.
15. Submit just your javascript file into Canvas.
